

Client Meeting (4th)

Project: VOC Sensor Data Pipeline for Disease Monitoring

Date: 31 March 2026

Stakeholder: Eyuel Ayele

Participants:

- Adityanand Singh
- Faezeh Kianimoravej
- Sepideh Qorbani

1. Purpose of the Meeting

The purpose of this meeting was to clarify the feedback received from instructors regarding the project submission, present the current project structure and technical setup, and align with the client on documentation, modeling approach, and final deliverables.

2. Project Context

The team recently submitted their project deliverables and received feedback related to submission format. Meanwhile, the project implementation (pipeline, tools, and structure) is progressing based on the client's requirements. This meeting focused on aligning expectations and defining a practical direction for completing the project within the remaining time.

3. Key Discussion Points

Submission feedback clarification

- The feedback from instructors was not technical.
- The issue was related to submission format:
 - ✓ Deliverables were submitted as a zipped folder
 - ✓ This was not aligned with course requirements
- No feedback was given on:
 - ✓ Data analysis
 - ✓ Feature engineering
 - ✓ Modeling

Client perspective on feedback

- Eyuel Ayele confirmed that:
 - ✓ The issue is procedural, not technical
 - ✓ It is not a major concern

- ✓ He may follow up internally if needed
- He also mentioned that it was not fully clear what materials were shared with instructors.

Project structure and tooling

- The project follows the required structure defined by the client
- A documentation folder is being developed, including:
 - ✓ Analysis document
 - ✓ Technical document
 - ✓ Final report
- Selected tools:
 - ✓ **Orchestration:** Apache Airflow
 - ✓ **Experiment tracking:** MLflow
 - ✓ **Data versioning:** DVC
 - ✓ **Testing:** Dedicated test folder
 - ✓ Inclusion of provided toolkit

Documentation approach (CRISP-DM inspired)

- The client recommended a structured approach similar to CRISP-DM
- Each phase should be clearly documented:
 - ✓ Data understanding
 - ✓ Data preparation
 - ✓ Feature engineering
 - ✓ Modeling
- Each step can be treated as a separate section/chapter
- Documentation should include:
 - ✓ Reasoning behind decisions
 - ✓ Data exploration
 - ✓ Modeling steps
- Well-structured documentation enables:
 - ✓ Better understanding
 - ✓ More effective feedback from the client

Focus on minimal viable solution

- Due to time constraints, the client advised:
 - ✓ Avoid overly complex implementations
 - ✓ signal fingerprints Focus on a working baseline solution
- Recommended approach:
 - ✓ Extract” from the dataset
 - ✓ Build a classification model based on these features

Testing and demo expectations

- Use a separate test dataset
- Demonstrate model performance on unseen data
- Prepare a clear demo pipeline for presentation

Dataset limitations and practical constraints

- The dataset has limited number of samples
- The client emphasized:
 - ✓ Be creative in analysis and modeling
 - ✓ Do not generate artificial data at this stage due to time constraints

Learning progress and project understanding

- The team indicated that:
 - ✓ The project was initially challenging
 - ✓ Understanding has improved as coursework progressed
- The client acknowledged that:
 - ✓ This is a short assignment compared to full graduation projects
 - ✓ The goal is to provide practical exposure within limited time

Next interaction and feedback loop

- The client requested:
 - ✓ Share results and documentation as soon as something is ready
 - ✓ He will provide feedback based on:

- Exploration approach
- Training process
- Clarity of documentation

4. Decisions Made

- The project should follow a structured CRISP-DM-like documentation approach
- The team should prioritize a simple, working baseline model
- Artificial data generation is not recommended given time constraints

5. Action Items

Action	Responsible
Adjust submission format according to course requirements	Student Team
Finalize structured documentation (analysis, technical, final report)	Student Team
Organize documentation using CRISP-DM-like phases	Student Team
Implement a classification model based on signal “fingerprints”	Student Team
Prepare separate test dataset and demo	Student Team
Share results and documentation for feedback	Student Team
Optionally follow up internally regarding submission feedback	Eyuel Ayele
Send presentation invitation for 15 April	Student Team

6. Open Questions

- What exact submission format is required by instructors?
- What materials were visible to instructors during evaluation?
- Will the final presentation be in-person or online?

7. Next Steps

1. Finalize structured documentation
2. Build a minimal working classification model
3. Prepare test dataset and demo

4. Share progress with the client for feedback
5. Prepare for final presentation (15 April)

8. Notes

- The client emphasized:
 - ✓ Clarity over complexity
 - ✓ Working solution over perfect solution
- The focus should be on delivering a clear, explainable, and demonstrable pipeline
